	PROBLEMS AND COURSE
Respiratory	Admitted with moderate-severe respiratory distress with grunting, CXR s/o Low lung volume, so in view of prematurity with chest x ray, kept as RDS. Initially kept on CPAP support, distress increases, so surfactant given, intubated, shifted to ventilator. Responded well, oxygen requirement decreased to minimal, extubated after 3 days & shifted on CPAP support. Baby having moderate distress, stabilise on CPAP support, weaned off CPAP over 2 day. Baby having mild distress oxygen requirement, not able to wean off oxygen so required HFNC support, currently fio2 21 % on HFNC.
CVS	Remained stable, no cardiac murmur present
CNS	Remained stable, no seizures during hospital stay, later started accepting feeding well, good reflexes present. Advised neuro-developmental follow up monthly till 1 year of age.
GI/Feeding	Keep NBM for admission, Started OG feeding on LD 2, well tolerated, increased gradually, currently NG feed 12 ml /2hrly, poor sucking efforts
Renal	Urine output adequate

Condition on

Vitally stable On HFNC, NG feed ml 12/2 hrly
Perfusion fair, CRT < 3 sec, Chest clear, CVS murmur absent
Good reflexes, AFAL, U/O adequate, stool passed
